

The default IP to use when connecting to the container when testing any changes you make in the code will be 192.168.99.100

How to view your container:

docker ps -a

****the containers name should be development-environment if it isn't the case then replace name in the following commands with the CONTAINER ID****

In order to start/stop the container:

docker start development-environment

docker stop development-environment

How to get inside the running container:

docker exec -it development-environment bash

If your container breaks you can recreate it with the following:

****make sure you are in the appStore directory**

docker rm development-environment = this will delete the container

docker run -itPv \$(pwd):/usr/src/appStore --name=development-environment

\$(docker images -q) bash = this will recreate the container

****if your mocha is giving errors which weren't occurring then nodes packages might have broken just delete the node_modules folder and then run npm i to install them for the correct base**
